Left truncation is not valid in the specified search field in the  
specified file. The term has been searched without left truncation.  
Examples: '?TERPEN?' would be searched as 'TERPEN?' and '?FLAVONOID'  
would be searched as 'FLAVONOID.'

If you are searching in a field that uses implied proximity, and you  
used a truncation symbol after a punctuation mark, the system may  
interpret the truncation symbol as being at the beginning of a term.  
Implied proximity is used in search fields indexed as single words,  
for example, the Basic Index.

AB The present invention concerns a method of protecting plants from pathogen

attack through synergistic disease resistance attained by applying a conventional microbicide to immunomodulated plants. Immunomodulated plants are those in which SAR is activated and are therefore referred to as "SAR-on" plants. Immunomodulated plants may be provided in at least three different ways: by applying to plants a chem. inducer of SAR such

as

BTH, INA, or SA; through a selective breeding program based on constitutive expression of SAR genes and/or a disease-resistant

phenotype;

or by transforming plants with one or more SAR genes such as a functional form of the NIM1 gene. By concurrently applying a microbicide to an immunomodulated plant, disease resistance is unexpectedly synergistically enhanced; i.e., the level of disease resistance is greater than the expected additive levels of disease resistance.

AN 2001-158874 [16] WPIDS

AB WO 200041861 A UPAB: 20010323

NOVELTY - The treatment of a wood substrate comprises:

(a) placing the substrate in a treatment vessel and reducing the pressure to remove air in the pores of the substrate;

(b) contacting the substrate with the formulation so that it flows into the pores, at a temperature at or above that required to cause the wax to become molten;

(c) applying a positive pressure to force the formulation into the pores; and

(d) releasing the pressure and removing the wood substrate.

USE - The formulation is used to treat certain wood species such as Southern Yellow Pine, Ponderosa Pine, Scots Pine, Hem-Fir, Red Pine, Jack Pine, Lodgepole Pine, Radiata Pine, Japanese Pine, Hoop Pine, red wood

and

cedar.

ADVANTAGE - The treatment confers water repellency to the wood substrate (claimed). The formulation has a high degree of shear stability and the lowest possible surface tension. After treatment the wood substrate is hot and drip-free and hence does not contaminate the surrounding environment. The elevated temperature increases the degree of penetration.

AB The efficacy of 7 fungicides was detd. in vitro against Puccinia helianthi, by assessing percentage inhibition of spore germination. Maximum inhibition of urediospore germination was obsd. in tridemorph (65.38%) which was at par with **cyproconazole** (64.35%). Least inhibition (26.78%) of urediospore germination was obsd. with carbendazim.

Same 7 fungicides and 3 plant exts. viz., neem seed kernel, Ocimum and Tridax exts. were tried for in vivo. Tridemorph (0.1%) was most effective in controlling rust, followed by chlorothalonil (0.2%) which was at par with mancozeb (0.2%). Maximum grain yield 9.21 q/ha was recorded in chlorothalonil which was at par with **cyproconazole** 9.13 q/ha and mancozeb.

- AB A method of increasing plant resistance to pathogens using a combination of conventional microbicides and genes involved in systemic acquired resistance (SAR) is described. SAR genes are expressed at a high level by chem. induction; by selective breeding of plants showing increased levels of SAR; or by introduction of SAR genes such as the NIM1 gene. The concurrent use of a microbicide and increased expression of SAR genes unexpectedly synergistically increases the level of disease resistance.
- A no. of fungicides were tested in pairwise combinations and shown to be synergistic. Arabidopsis mutants showing constitutive immunity (cim2 and cim3) were obtained and tested for synergism with fungicides. Metalaxyl and benzo[1,2,3]thiadiazole-7-carbothioic acid-S-Me ester interacted synergistically with a cim3 mutation. Overexpression of the NIM1 gene for a plant I.kappa.B.alpha. homolog involved in SAR also increased the effectiveness of microbicides synergistically.

AB Fruit and leaf spot disease of citrus caused by *P. angolensis* has become the main disease of the crop in western Kenya. A no. of contact and systemic fungicides were evaluated against the pathogen in vitro and for disease control in the field. The triazoles were most inhibitory to the fungus in Petri dish tests, but fluzilazole gave the best control in the field. AB Twenty-five wound dressing compounds were screened for control of *Chondrostereum purpureum* infection of pruning wounds on willows (*Salix* spp.), apples (*Malus domestica*), and golden queen peaches (*Prunus persica*). None were completely effective but products giving best control were: Garrison; Shell pruning grease; and **cyproconazole** + iodocarb. C. *purpureum* infection with Nectec Liquid and **copper** oxychloride treatments was significantly (P < 0.05) greater than the control indicating a reduced host resistance either directly or by elimination of antagonists. Application of the biocontrol fungus *Trichoderma viride* to wounds failed to give significant (P < 0.05)

control of *C. purpureum* infection in willows and peaches. Scanning electron microscopy of field exposed wound dressings revealed considerable differences in film integrity with fissures, pores, and fungal hyphae evident.

AB Addn. of Cu fungicides to triazole fungicides decreases the activity of the latter. This effect is eliminated, and even some enhancement of activity is achieved, when C10-50 hydrocarbons are added to the mixt. Hydrocarbon blends, such as vaseline oil, may be used instead of the individual hydrocarbons. Tetraconazole (50 g/ha) controlled *Cercospora beticola* in field expts. by 83%. Addn of 900 g Cu oxychloride/ha decreased the effectiveness of tetraconazole to 70%. When 500 g vaseline oil/ha was added to the binary mixt., the fungicidal effectiveness rose to 95%.

AB An in vitro study of the activity of several fungicides on some biol. phases of *D. teres* (mycelial growth, conidial germination, sporulation) showed that the form *teres* is more sensible than the form *maculata*. Some contact fungicides like anilazine and chlorothalonil were the most active on conidial germination. Systemic fungicides, particularly imidazoles (imazalil, prochloraz) and triazoles (diniconazol, flusilazol, propiconazol) were active on mycelial growth. Iprodione and **copper** oxyquinoleate were equally efficient on mycelial growth and conidial germination. Sporulation of the f. *maculata* was little inhibited

by prochloraz, diniconazol and M 14360 EC which completely inhibited sporulation of the f. *teres*. Anilazine affected sporulation as well as other biol. phases of the pathogen.

 GI

AB Diseases of pruning wounds of perennial plants could be controlled by fungicidal formulations contg. compds. of the general formula I, where X =

H or Cl and R = Bu, 1-cyclopropylethyl or 1-cyclopropyl-1-methylethyl. Thus, I(X = H and R = 1-cyclopropylethyl) 10, silica 4, Na laurylsulfate 3, Na lignosulfonate 7, finely divided kaolin 66, and diatomaceous earth (5 .mu.) 10 parts were mixed, and dild. by water and applied by spraying. The compn. was applied by a special app. to control Eutypa lata in pruned grapes. The compn. might contain a nonphytotoxic hydrobic oil vehicle and/or thixotropic adjuvant.

 AN 1989-025926 [04] WPIDS  
 AB EP 300777 A UPAB: 19930923

To control eyespot in cereals, an eyespot fungicide is applied at a rate of 100-2000, pref. 200-1000, g/ha. to the ground where the cereal is planted, before emergence of the cereal plant. Pef. the fungicide is an ergosterol biosynthesis inhibitor (EBI) and the pref. cpd. is prochloraz i.e. N-propyl-N-(2-(2,4,5- trichlorophenoxy)ethyl) -imidazole-1-carboxamide, which may be used as the free base o a metal complex e.g.

the manganese or **copper** chloride complex. Others include **cyproconazole**, flusilazole etc.

ADVANTAGE - Pre-emergent application of fungicide gives at least as good, if not better, control of eyespot than post-emergent application. Pre-emergent application is easier than post emergent, and an extra spraying operation can be avoided by applying pre-emergentherbiides at

the same time. Also post emergent application may be too late to obtain optimum control.

Left truncation is not valid in the specified search field in the specified file. The term has been searched without left truncation. Examples: '?TERPEN?' would be searched as 'TERPEN?' and '?FLAVONOID' would be searched as 'FLAVONOID.'

If you are searching in a field that uses implied proximity, and you used a truncation symbol after a punctuation mark, the system may interpret the truncation symbol as being at the beginning of a term. Implied proximity is used in search fields indexed as single words, for example, the Basic Index.
